

UNDETECTED PROVISION OF AUXILIARY SERVICES DURING A
TELEPHONE CONVERSATION

ABSTRACT OF THE INVENTION

5 A telephone system for undetected provision of an
auxiliary service during a telephone conversation between
at least two participants over a communications network.
The system includes a handset, having an input mechanism
operable by a requesting participant to submit a request
for an auxiliary service to be provided during the
10 conversation, and a service processor, adapted to receive
the request over the network and to provide the requested
auxiliary service responsive to the request, such that at
least one of the other participants receives substantially
no indication of the request.
